Optimisation Techniques LAB 7

Aim:

1. Implement all 37 algorithms from scratch and explain in your own words what each one actually does, step by step.
2. State the advantages and disadvantages of each algorithm, and prove them with your own experiments (plots and numbers).
3. Choose a suitable algorithm for a given problem using convexity, number of objectives, variable type, constraints, preferences and budget.
4. Measure front quality with Hypervolume, IGD and Spacing.
